

1. MongoDB Compass connect string to your Atlas server:
`'mongodb+srv://ekoziicki:EKozickiProject3Events@cluster0.ssvzwhn.mongodb.net/project3?retryWrites=true&w=majority&appName=Cluster0';`
2. Explanation of additional features.
 - I did not include any additional features.
3. Explanation of status, stopping point, and issues if incomplete.
 - a. I was not able to do a few things for this project. The first one was displaying titles of events that a user has RSVPed for. Another thing was converting start and end dates from project 3 from mongodb to js date time; since I was still not able to do that, I could not write functions that validated the start date being before the end date etc. I was also unable to figure out how to display user's name with the profile tab which was from project 4. I was also unable to count the number of RSVPs for each event because I was not sure how to pass the date to the showEvent page although I tried it a few different ways.
4. Discuss the easy and challenging parts of the assignment. How did you overcome all or some of the challenges?
 - Overall, this assignment was pretty challenging just like the previous projects. I am a little disappointed that I was unable to complete this last project and the couple of previous projects in 100%. I could barely find any helpful resources online and even TAs could not help me figure out certain things.
